

# COMP1204: Data Management

## Coursework One: Hurricane Monitoring

Damien Ta  
34830294

February 29, 2024

### **1 Introduction**

As data scientists for the National Oceanographic and Atmospheric Administration Centre, I was assigned to the tropical cyclone tracking team. As a data scientist I have been tasked with extracting storm data from the tropical cyclone reports and producing maps of where the cyclones have taken place.

## 2 Create CSV Script

### 2.1 How to run script

#### Script to run create\_csv.sh

```
./create_csv.sh <input_kml_file> <output_csv_file>
```

This command runs the create\_csv.sh file which takes in a kml file and extracts specific header tag data. The command takes extracted data and saves it to a CSV file.

### 2.2 Full Script

#### create\_csv.sh

```
1  #!/bin/bash
2  csv_input_path=$1
3  tmp_csv_output=$2
4
5  echo "Timestamp,Latitude,Longitude,MinSeaLevelPressure,MaxIntensity" > $tmp_csv_output
6  dtg="$(grep -R "<dtg>" $csv_input_path | sed 's/.*<dtg> //' | sed 's/[</dtg>] //g')"
```

```
7  grep -R "<lat>" $csv_input_path | sed 's/.*<lat> //' | sed 's/[</lat>] //g' > lat.csv
8  grep -R "<lon>" $csv_input_path | sed 's/.*<lon> //' | sed 's/[</lon>] //g' > lon.csv
9  grep -R "<minSeaLevelPres>" $csv_input_path | sed 's/.*<minSeaLevelPres> //' | /
10 sed 's/[</minSeaLevelPres>] //g' > minSeaLevelPres.csv
11 grep -R "<intensity>" $csv_input_path | sed 's/.*<intensity> //' | /
12 sed 's/[</intensity>] //g' > intensity.csv
13
14 lat="$(sed "s/$/ N/" lat.csv)"
15 lon="$(sed "s/$/ W/" lon.csv)"
16 minSeaLevelPres="$(sed "s/$/ mb/" minSeaLevelPres.csv)"
17 maxIntensity="$(sed "s/$/ knots/" intensity.csv)"
18
19 paste -d',' <(echo "$dtg") <(echo "$lat") <(echo "$lon") <(echo "$minSeaLevelPres") \
20 <(echo "$maxIntensity") >> $tmp_csv_output
21
22 rm lat.csv
23 rm lon.csv
24 rm minSeaLevelPres.csv
25 rm intensity.csv
26 #I used / to continue command on next line
```

## 2.3 Script Breakdown

### 2.3.1 Bash Initialization and Passing Arguments into a variable

#### First part of the code

```
1 #!/bin/bash
2 csv_input_path=$1
3 tmp_csv_output=$2
```

`#!/bin/bash`

tells the terminal that when you run the script it should use bash to execute it

`csv_input_path=$1`

`tmp_csv_output=$2`

These two lines of code allow inputs to be entered into the script

### 2.3.2 Using grep and sed to filter data of tag headers

#### Second part of the code

```
5 echo "Timestamp,Latitude,Longitude,MinSeaLevelPressure,MaxIntensity" > $tmp_csv_output
6 dtg="$(grep -R "<dtg>" $csv_input_path | sed 's/.*<dtg>//g' | sed 's/[</dtg>]//g')"
7 grep -R "<lat>" $csv_input_path | sed 's/.*<lat>//g' | sed 's/[</lat>]//g' > lat.csv
8 grep -R "<lon>" $csv_input_path | sed 's/.*<lon>//g' | sed 's/[</lon>]//g' > lon.csv
9 grep -R "<minSeaLevelPres>" $csv_input_path | sed 's/.*<minSeaLevelPres>//g' | \
10 sed 's/[</minSeaLevelPres>]//g' > minSeaLevelPres.csv
11 grep -R "<intensity>" $csv_input_path | sed 's/.*<intensity>//g' | \
12 sed 's/[</intensity>]//g' > intensity.csv
```

`echo "Timestamp,Latitude,Longitude,MinSeaLevelPressure,MaxIntensity" > $tmp_csv_output`

This command prints the tag headers

`dtg="$(grep -R "<dtg>" $csv_input_path | sed 's/.*<dtg>//g' | sed 's/[</dtg>]//g')"`

The code creates variable dtg, we grep the kml file inputted at \$1 and search recursively for keyword <dtg>. The sed 's/.\*<dtg>//g' command would replace any character and its occurrences with an empty space including anything before the pattern.

the sed 's/[</dtg>]//g' command would replace any characters between the [], so < / d t g > to an empty character and the g stands for global.

`grep -R "<lat>" $csv_input_path | sed 's/.*<lat>//g' | sed 's/[</lat>]//g' > lat.csv`

grep recursively keyword <lat> from the kml file inputted

The sed 's/.\*<dtg>//g' command would replace any character and its occurrences with an empty space including anything before the pattern.

The sed 's/[</lat>]//g' command would replace any characters between the [], so < / l a t >

The outcome is then appended to a file called lat.csv for later use. This same code is then run on the rest of the tag headers Longitude, MinSeaLevelPressure and MaxIntensity.

### 2.3.3 Adding units to the end of certain tag headers

#### Third part of the code

```
14 lat="$(sed "s/$/ N/" lat.csv)"
15 lon="$(sed "s/$/ W/" lon.csv)"
16 minSeaLevelPres="$(sed "s/$/ mb/" minSeaLevelPres.csv)"
17 maxIntensity="$(sed "s/$/ knots/" intensity.csv)"
```

```
lat="$(sed "s/$/ N/" lat.csv)"
```

New variable lat is created which uses sed and adds on each line (\$) " N" from file lat.csv  
This is then run on each line of code for longitude, minSeaLevelPres and maxIntensity for their respective unit of measure.

### 2.3.4 Outputting results to file

#### Fourth part of the code

```
19 paste -d',' <(echo "$dtg") <(echo "$lat") <(echo "$lon") <(echo "$minSeaLevelPres") /
20 <(echo "$maxIntensity") >> $tmp_csv_output
```

```
paste -d',' <(echo "$dtg") <(echo "$lat") <(echo "$lon") <(echo "$minSeaLevelPres") /
<(echo "$maxIntensity") >> $tmp_csv_output
```

This code concatenates the variables we created earlier into the file at \$2.  
-d',' would add delimiter , after each of the inputs. The < allows you to use an output of a command as if it were a file.

### 2.3.5 Removing temporary files from directory

#### Last part of the code

```
22 rm lat.csv
23 rm lon.csv
24 rm minSeaLevelPres.csv
25 rm intensity.csv
```

```
rm lat.csv
```

rm would remove the file from the current directory. It does this for all temporary files created.

### 3 Storm Plots

#### 3.1 Storm Plot 1

Figure 1: al112020.kml

### 3.2 Storm Plot 2

Figure 2: al012020.kml

### 3.3 Storm Plot 3

Figure 3: al102020.kml

## 4 Git Usage

### 4.1 How to run the conflict script

#### Run Conflict Script

```
./conflict-script.sh
```

### 4.2 Breakdown of how to fix the conflict

#### 4.2.1 Check current branch

First thing I did, was check to see if I was on correct branch and to see if conflict script actually ran I saw that python-addon was one of the branches meaning the conflict script ran.

```
git branch
```

#### 4.2.2 Merge the python-addon branch to main branch

As the conflict script has already run, we were tasked with merging the python-addon branch to the main branch. We did this using the command below. However, when we attempted to merge the two branches a conflict occurred.

```
git merge python-addon
```

#### 4.2.3 Resolving the conflict

I opened the python-plot-script.py in my text editor of choice (VSCode) then resolved the conflict by compiling different parts of each scripts into one script. One of the errors was that we forgot to import math in one of the pieces of code which I edited. Another error was that in the function plot\_all\_csv\_pressure one of the scripts had misspelt for and wrote it as fr. I picked the correct function and moved on. Lastly, the last error I changed was that one of the scripts was missing a whole function called plot\_all\_csv\_intensity which I added to the combined script.

#### Git Add

```
git add
```

#### Git Merge

```
git merge
```

#### Git Push

```
git push
```

## Python Code for Plotting CSV Data

```
import pandas as pd
import matplotlib.pyplot as plt
import os
import glob
import math
user_key = 1773

def plot_all_csv_pressure():
    path = os.getcwd()
    csv_files = glob.glob(os.path.join(path, '*.csv'))

    for f in csv_files:
        storm = pd.read_csv(f)
        storm['Pressure'].plot()
        plt.show()

def plot_all_csv_intensity():
    path = os.getcwd()
    csv_files = glob.glob(os.path.join(path, '*.csv'))

    for f in csv_files:
        storm = pd.read_csv(f)
        storm['Intensity'].plot()
        plt.show()
```
